

To all interested parties,

Cashman Dredging & Marine Contractors (CDMC) is hiring experienced Field Engineers, Assistant Project Engineers, and Project Engineers in the field of dredging, marine surveying, and marine construction. A B.S. degree in civil engineering, ocean/marine engineering, construction management, survey engineering, or general dredging experience are all welcome. The CDMC survey/engineering department is hiring due to the recent start of a large environmental dredging project located in up-state NY. This particular type of environmental dredging is one of the most complicated, technically and operationally challenging projects ever bid in the United States. We are looking for intelligent individuals who are willing to work in an ever-changing marine environment. The ideal candidate will pose the patience to trouble shoot technical issues, and simply achieve project goals. Our department is currently expanding and the growth potential is only limited by the individual. The above position is field based and located on the Hudson River in up-state New York. The candidate positions are tasked with duties such as, but not limited too: hydro surveying, land surveying, volume computations, project layout, dredge instrumentation installation and upkeep, survey quality control, and general dredge support. Compensation will be based on experience. Apart from dredging, Jay Cashman Inc, is involved in industries such as heavy civil construction, marine construction, and wind power. Please see the Jay Cashman website for more information and this opportunity:
